

Cambridge International Examinations

Cambridge International Advanced Subsidiary and Advanced Level

Additional Mate	rials: As listed in the Confidential Instr	uctions
Candidates ans	wer on the Question Paper.	2 Hours
Paper 3 Advan	ced Practical Skills 1	February/March 2018 2 hours
CHEMISTRY		9701/33
CENTRE NUMBER		CANDIDATE NUMBER
CANDIDATE NAME		
AS & A Level		

Write your Centre number, candidate number and name on all the work you hand in.

Give details of the practical session and laboratory where appropriate, in the boxes provided.

Write in dark blue or black pen.

You may use an HB pencil for any diagrams or graphs.

Do not use staples, paper clips, glue or correction fluid.

DO **NOT** WRITE IN ANY BARCODES.

Answer all questions.

Electronic calculators may be used.

You may lose marks if you do not show your working or if you do not use appropriate units.

Use of a Data Booklet is unnecessary.

Qualitative Analysis Notes are printed on pages 14 and 15.

A copy of the Periodic Table is printed on page 16.

At the end of the examination, fasten all your work securely together. The number of marks is given in brackets [] at the end of each question or part question.

This document consists of 14 printed pages, 2 blank pages and 1 Insert.

PLATINUN BUSINESS ACADEM 0777898626

Quantitative Analysis

Read through the whole method before starting any practical work. Where appropriate, prepare a table for your results in the space provided.

Show your working and appropriate significant figures in the final answer to **each** step of your calculations.

1 You will investigate how increasing temperature affects the rate of a reaction.

Sodium thiosulfate reacts with acid to form a pale yellow precipitate of sulfur. The ionic equation for the reaction is given.

$$S_2O_3^{2-}(aq) + 2H^+(aq) \rightarrow S(s) + SO_2(q) + H_2O(1)$$

You will measure the time it takes for the sulfur formed in the reaction to obscure the print on the Insert supplied.

Record your results in a table on page 4. Your table should include the rate of reaction for each experiment.

FA 1 is an $18.1 \,\mathrm{g}\,\mathrm{dm}^{-3}$ solution of hydrated sodium thiosulfate, $\mathrm{Na_2S_2O_3.5H_2O}$. **FA 2** is a $0.050\,\mathrm{mol}\,\mathrm{dm}^{-3}$ solution of a strong monoprotic acid, H**Z**.

(a) Method

- Approximately half fill the 250 cm³ beaker with tap water and place it on the tripod and gauze over the Bunsen burner.
- Heat the water in the beaker to about 55 °C and then switch off the Bunsen burner. This will be your hot water bath.
- Use the 25 cm³ measuring cylinder to transfer 10 cm³ of **FA 1** into boiling tube **1**. Place boiling tube **1** into your hot water bath.
- Use the 50 cm³ measuring cylinder to transfer 20 cm³ of **FA 2** into boiling tube **2**. Place boiling tube **2** into your hot water bath.
- Leave boiling tubes 1 and 2 in the hot water bath to heat up for use in **Experiment 2**.
- Start Experiment 1.

Experiment 1

- Use the 50 cm³ measuring cylinder to transfer 20 cm³ of **FA 2** into the 100 cm³ beaker.
- Measure and record the temperature of FA 2.
- Use the 25 cm³ measuring cylinder to transfer 10 cm³ of **FA 1** into the same beaker and start timing **immediately**.
- Swirl the beaker once to mix the solutions and place the beaker on the Insert.
- Look down through the beaker and contents onto the Insert.
- Stop timing as soon as the precipitate of sulfur obscures the print on the Insert.
- Record the reaction time to the nearest second.
- Empty the contents of the beaker into the quenching bath.
- Rinse and dry the beaker so it is ready for use in **Experiment 2**.

Experiment 2

- Measure and record the temperature of **FA 2** in boiling tube **2**.
- Carefully transfer the hot contents of boiling tube 2 into the 100 cm³ beaker.
- Carefully transfer the hot contents of boiling tube 1 into the same beaker and start timing immediately.
- Swirl the beaker once to mix the solutions and place the beaker on the Insert.
- Look down through the beaker and contents onto the Insert.
- Stop timing as soon as the precipitate of sulfur obscures the print on the Insert.
- Record the reaction time to the nearest second.
- Empty the contents of the beaker into the guenching bath.
- Rinse and dry the beaker so it is ready for use in Experiment 3.

Experiment 3

- Use the 25 cm³ measuring cylinder to transfer 10 cm³ of **FA 1** into boiling tube **1**. Place boiling tube **1** into your hot water bath.
- Use the 50 cm³ measuring cylinder to transfer 20 cm³ of **FA 2** into boiling tube **2**. Place boiling tube **2** into your hot water bath.
- Place the thermometer in boiling tube 2. When the temperature of **FA 2** is about 8 °C lower than that for **Experiment 2** record the temperature. Remove the thermometer and transfer the contents of boiling tube 2 into the 100 cm³ beaker.
- Transfer the contents of boiling tube 1 into the same beaker and start timing immediately.
- Swirl the beaker once to mix the solutions and place the beaker on the Insert.
- Look down through the beaker and contents onto the Insert.
- Stop timing as soon as the precipitate of sulfur obscures the print on the Insert.
- Record the reaction time to the nearest second.
- Empty the contents of the beaker into the quenching bath.
- Rinse and dry the beaker so it is ready for use in Experiments 4 and 5.

Experiments 4 and 5

- Repeat the method for Experiment 3 but at two different temperatures.
- Keep the temperature of FA 2 between room temperature and 55 °C. Do not exceed 55 °C.

Record all your results in your table on page 4.

PLATINUN BUSINESS ACADEM 0777898626

Results

The rate of reaction can be calculated as shown.

$$rate = \frac{1000}{reaction time}$$

Calculate the rate of reaction for each of your **five** experiments. Record these rates in your table.

I	
II	
III	
IV	
V	
VI	
VII	
VIII	

[8]

(b) On the grid plot a graph of rate of reaction on the *y*-axis, starting at zero, against temperature on the *x*-axis. Select a scale for the *x*-axis which includes a temperature of 15.0 °C. Label your axes and any points you consider anomalous.

Draw a line of best fit and extrapolate it to 15.0 °C.

Qualitative Analysis

Where reagents are selected for use in a test, the **name** or **correct formula** of the element or compound must be given.

At each stage of any test you are to record details of the following:

- colour changes seen;
- the formation of any precipitate and its solubility in an excess of the reagent added;
- the formation of any gas and its identification by a suitable test.

You should indicate clearly at what stage in a test a change occurs.

If any solution is warmed, a **boiling tube** must be used.

Rinse and reuse test-tubes and boiling tubes where possible.

No additional tests for ions present should be attempted.

2 (a) FA 3 is a more concentrated solution of the strong monoprotic acid, HZ, used for Question

Select **two** sets of reagents and suitable apparatus to use in **two** separate tests, **Test 1** and **Test 2**, to investigate the identity of the anion, \mathbf{Z}^- , present in **FA 3**. The anion is one of those listed in the Qualitative Analysis Notes.

Complete the 'test' boxes in the table **before** starting any practical work by circling whether you would use a test-tube or a boiling tube, and stating which reagents you would use.

Carry out your tests and record your observations. You must carry out both Test 1 and Test 2.

test	observations
Test 1	
To a 1 cm depth of FA 3 in a	
test-tube/boiling tube	
add	
(reagent(s))	
Test 2	
To a 1 cm depth of FA 3 in a	
test-tube/boiling tube	
add	
(reagent(s))	
	[4]
(b) Identify the anion present in HZ from your	observations in (a).
Z - is	[1]

(c) FA 4 and FA 5 both contain one cation and one anion. The ions present in FA 4 are differe from the ions present in FA 5. All four ions are listed in the Qualitative Analysis Notes. You are to identify the four different ions.

Carry out the following tests and record your observations.

test	observations
To a small spatula measure of FA 4 in a boiling tube, add a 4 cm depth of FA 3 and shake the tube well. Leave the tube to stand for at least five minutes. Label the solution formed FA 6 .	
To a 1 cm depth of FA 5 in a test-tube, add aqueous sodium carbonate.	
To a 1 cm depth of FA 5 in a test-tube, add aqueous sodium hydroxide.	
To a 1 cm depth of FA 5 in a test-tube, add aqueous ammonia.	
To a 1 cm depth of FA 5 in a test-tube, add a few drops of aqueous silver nitrate.	
To a 1 cm depth of FA 5 in a test-tube, add a few drops of aqueous barium chloride or aqueous barium nitrate, then	
add a 1 cm depth of a suitable acid.	
To a 1 cm depth of FA 6 in a test-tube, add aqueous sodium hydroxide.	
To a 1 cm depth of FA 6 in a test-tube, add aqueous ammonia.	
To a 1 cm depth of FA 6 in a test-tube, add dilute sulfuric acid.	
To a 1 cm depth of FA 6 in a test-tube, add a 1 cm depth of FA 5 .	

(d)	Give the formula of the acid you added to the mixture of FA 5 and aqueous barium chloride	077789862
	aqueous barium nitrate in (c).	

The acid added was [1]

(e) Identify the ions present in FA 4 and FA 5 from your observations in (c).

	cation	anion

ion	NaOH(aq)	NH ₃ (aq)									
aluminium, Al³+(aq)	white ppt. soluble in excess	white ppt. insoluble in excess									
ammonium, NH ₄ ⁺ (aq)	no ppt. ammonia produced on heating	-									
barium, Ba ²⁺ (aq)	faint white ppt. is nearly always observed unless reagents are pure	no ppt.									
calcium, Ca ²⁺ (aq)	white ppt. with high [Ca ²⁺ (aq)]	no ppt.									
chromium(III), Cr³+(aq)	grey-green ppt. soluble in excess	grey-green ppt. insoluble in excess									
copper(II), Cu ²⁺ (aq)	pale blue ppt. insoluble in excess	blue ppt. soluble in excess giving dark blue solution									
iron(II), Fe ²⁺ (aq)	green ppt. turning brown on contact with air insoluble in excess	green ppt. turning brown on contact with air insoluble in excess									
iron(III), Fe³+(aq)	red-brown ppt. insoluble in excess	red-brown ppt. insoluble in excess									
magnesium, Mg²+(aq)	white ppt. insoluble in excess	white ppt. insoluble in excess									
manganese(II), Mn²+(aq)	off-white ppt. rapidly turning brown on contact with air insoluble in excess	off-white ppt. rapidly turning brown on contact with air insoluble in excess									
zinc, Zn²+(aq)	white ppt. soluble in excess	white ppt. soluble in excess									

2 Reactions of anions

ion	reaction
carbonate, CO ₃ ²⁻	CO ₂ liberated by dilute acids
chloride, Cl ⁻ (aq)	gives white ppt. with Ag ⁺ (aq) (soluble in NH ₃ (aq))
bromide, Br ⁻ (aq)	gives cream ppt. with Ag ⁺ (aq) (partially soluble in NH ₃ (aq))
iodide, I-(aq)	gives yellow ppt. with Ag ⁺ (aq) (insoluble in NH ₃ (aq))
nitrate, NO ₃ ⁻ (aq)	NH ₃ liberated on heating with OH ⁻ (aq) and A <i>l</i> foil
nitrite, NO ₂ ⁻ (aq)	NH ₃ liberated on heating with OH ⁻ (aq) and A <i>l</i> foil
sulfate, SO ₄ ²⁻ (aq)	gives white ppt. with Ba ²⁺ (aq) (insoluble in excess dilute strong acids)
sulfite, SO ₃ ²⁻ (aq)	gives white ppt. with Ba ²⁺ (aq) (soluble in excess dilute strong acids)

3 Tests for gases

gas	test and test result
ammonia, NH ₃	turns damp red litmus paper blue
carbon dioxide, CO ₂	gives a white ppt. with limewater (ppt. dissolves with excess CO ₂)
chlorine, Cl ₂	bleaches damp litmus paper
hydrogen, H ₂	'pops' with a lighted splint
oxygen, O ₂	relights a glowing splint
